## 1 Introduction

During the better part of the course we have studied linear phenomena, that is the interaction between matter and light described by the wave equation

$$\nabla^2 \mathbf{E} - \frac{1}{c^2} \frac{\partial^2 \mathbf{E}}{\partial t^2} = \frac{1}{\epsilon_0 c^2} \frac{\partial^2 \mathbf{P}}{\partial t^2}, \quad (1)$$

where the polarization  $\mathbf{P}$  is linear wrt. the electric field of the light  $\mathbf{E}$ , as described by  $\mathbf{P} = \epsilon_0 \chi \mathbf{E}$ , where  $\chi$  is electric susceptibility of the medium. The course has touched upon non-linear phenomena, where the polarization can be expanded as  $\mathbf{P} = \epsilon_0 (\chi^{(1)} \mathbf{E} + \chi^{(2)} \mathbf{E}^2 + \dots)$ .

In this project we describe and discuss two such effects, namely beam self-focusing using the Kerr effect, and wave mixing.

## **2 The Kerr effect**

### **3 Wave mixing**
